# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized, total beds occupied, and the percent of total beds authorized which are occupied.

Total beds authorized are those defined in par. 36h of AR 40-1080, Changes No. 2 and No. 3 and do not include beds in dispensaries, convalescent facilities, venereal disease facilities and college or university training units.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 13 OCTOBER 1944

## COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATESAll Causes: Disease and Injury:

During the week ending 13 October 1944, the admission rate from all causes decreased by about 5 percent to 570 per year per thousand strength. The current morbidity rate is about 20 percent lower than for the corresponding week of 1943. Morbidity from all diseases combined decreased by 4 percent to 505 per thousand. The current admission rate from disease continues about 20 percent under that for the corresponding week of 1943.

The admission rate from injury decreased to 65 per thousand from 71 per thousand for the previous week. It is believed that a portion of this decrease reflects the recently issued clarification as to what constitutes a reportable injury; this provided that readmitted cases and injuries existing prior to entry into active service should be reported as "disease" rather than as "injury." Because of this, it may be anticipated that the injury admission rate for some weeks to come may show more of a downward tendency than would otherwise have prevailed.

Respiratory Causes:

Morbidity from colds, influenza, etc. increased from 87 per thousand the previous week to 92 per thousand for the current week, which is the highest rate reported since the week ending 26 May 1944. Nevertheless, the admission rate for the current week is 12 percent lower than for the corresponding week of 1943.

The admission rate from pneumonia remained at 7 per thousand and was at the highest point since the middle of July. However, morbidity from this cause

continues to be about 25 percent lower than during the corresponding period of 1943.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased slightly from the rate of 34 per thousand for the previous week to 36 per thousand for the current week. Morbidity from these causes is about 45 percent higher than for the corresponding week of 1943.

Morbidity from diarrhea and dysentery decreased from the relatively high rate of 13 per thousand recorded the previous week to 10 per thousand for the current week. Morbidity from this cause for the current week is about the same as that prevailing for the corresponding period of 1943.

The number of new cases of meningitis reported was 25 or at about the same level as has prevailed throughout the last three months. The number of new cases of rheumatic fever decreased to 40 which is the minimum figure recorded thus far this year. During the current week, the new cases of poliomyelitis numbered 6 or somewhat below the average for the past two months.

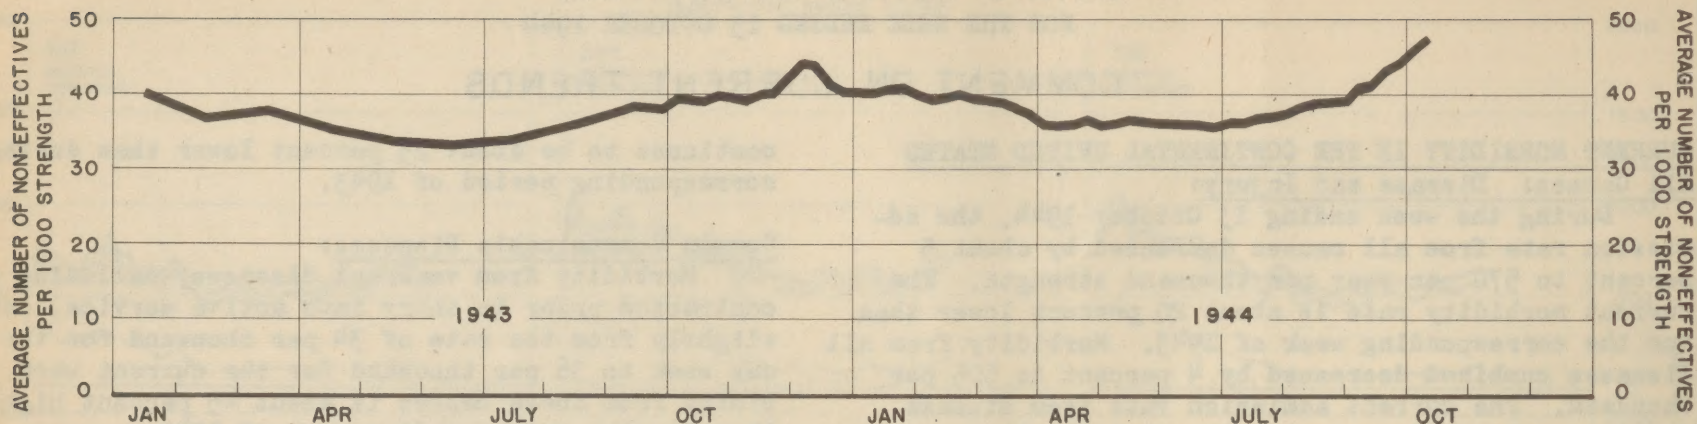

VARIATIONS IN MORBIDITY BY SERVICE COMMANDAll Causes: Disease and Injury:

The admission rate from disease decreased sharply (by 10 percent or more) in the Sixth and Seventh Service Commands, while smaller decreases were also reported by the Fourth and Eighth Service Commands. Only the First, Fifth, and Ninth Service Commands showed relatively small increases in morbidity.

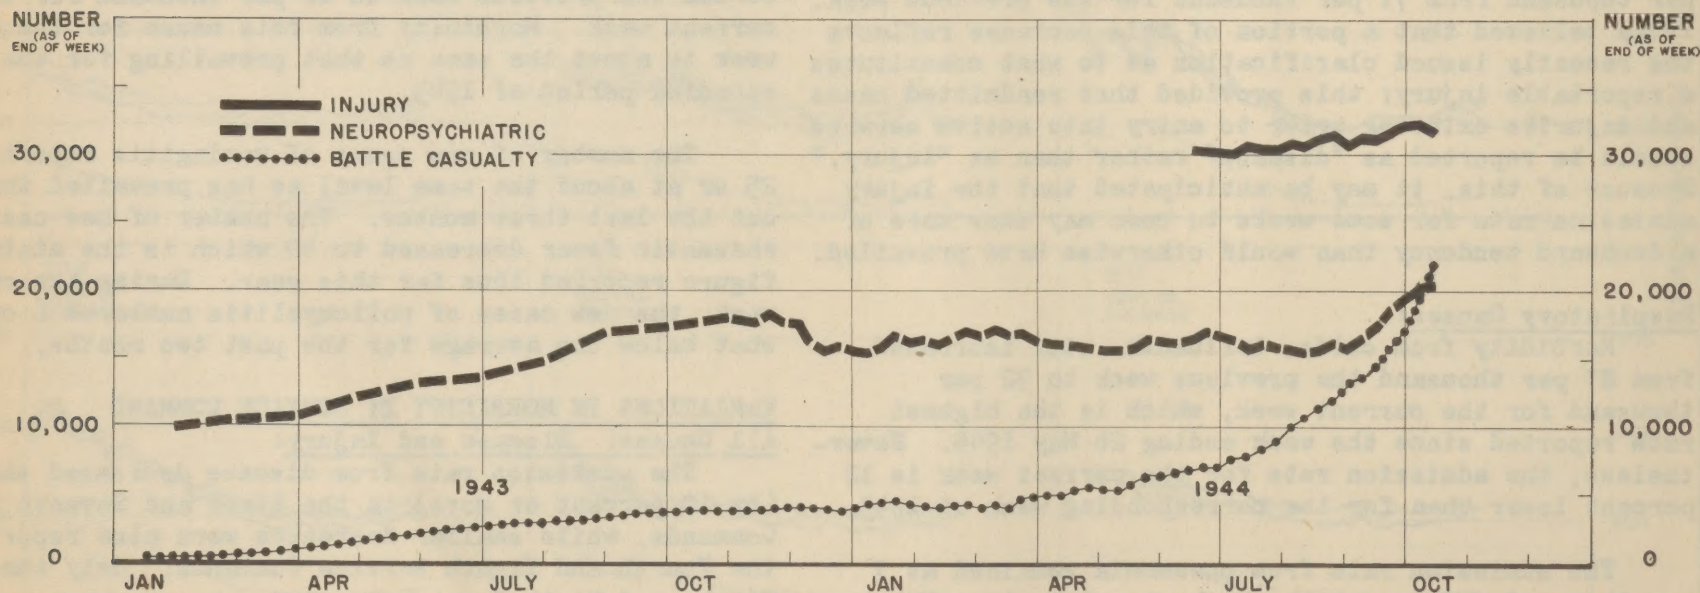

# NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

# PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

## COMMENT ON CURRENT TRENDS (CONT'D)

The First and Second Service Commands reported the highest morbidity from all causes (about 700 per thousand) and from disease (about 650 per thousand). The lowest morbidity from all causes (519 per thousand) and from disease (450 per thousand) was registered in the Eighth Service Command which in previous weeks had also reported very low morbidity.

Sharp decreases in morbidity from injury were reported by the First, Second, Sixth, Eighth, and Ninth Service Commands with only the Third Service Command and the Military District of Washington showing significant increases. Only the Fourth Service Command (with a rate of 74 per thousand) reported morbidity from this cause in excess of 70 per thousand. The First Service Command, with a rate of 45 per thousand, reported the lowest admission rate from injury followed by the Second and Seventh Service Commands with rates of 51 per thousand.

Respiratory Causes:

The admission rate from colds, influenza, etc. increased significantly (10 percent or more) in the Fourth, Fifth, and Eighth Service Commands while the Third and Seventh Service Commands reported decreases.

The Military District of Washington again reported by far the highest morbidity from colds, influenza, etc. (169 per thousand), followed by the Second Service Command (141 per thousand). The Fourth and Eighth Service Commands with rates of 78 per thousand reported the lowest morbidity from these causes.

Morbidity from pneumonia remained about the

same in most Service Commands; however, significant increases did occur in the Second, Third, and Seventh Service Commands. The Sixth Service Command with a rate of 16 per thousand, or more than double that for the country as a whole, reported the highest morbidity from this cause.

Common Communicable Diseases:

Morbidity from "new" (excluding EPTS) cases increased sharply in the First, Second, Third, and Seventh Service Commands. The First Service Command reported the highest morbidity from these causes (63 per thousand) followed by the Second, Third, and Fifth Service Commands with rates of about 50 per thousand. The high morbidity in the First and Second Service Commands is due in part to the large numbers of task force troops not under the jurisdiction of these Commands.

A marked decrease in morbidity from diarrhea and dysentery was reported in the Seventh Service Command which in the previous week had had an abnormally high rate. The Seventh and Eighth Service Command, with rates of about 15 per thousand, reported the highest morbidity from this cause.

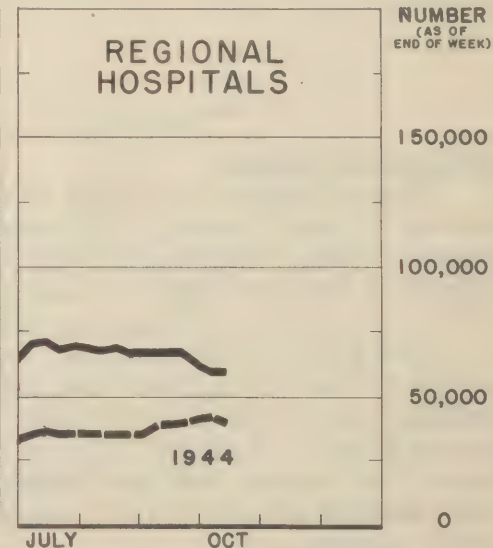

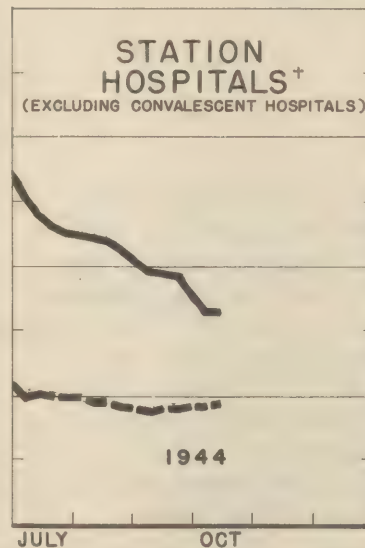

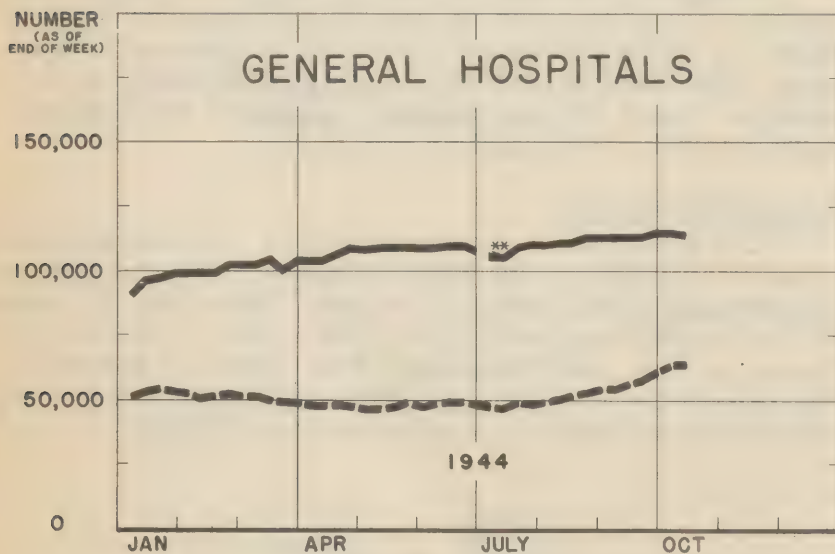

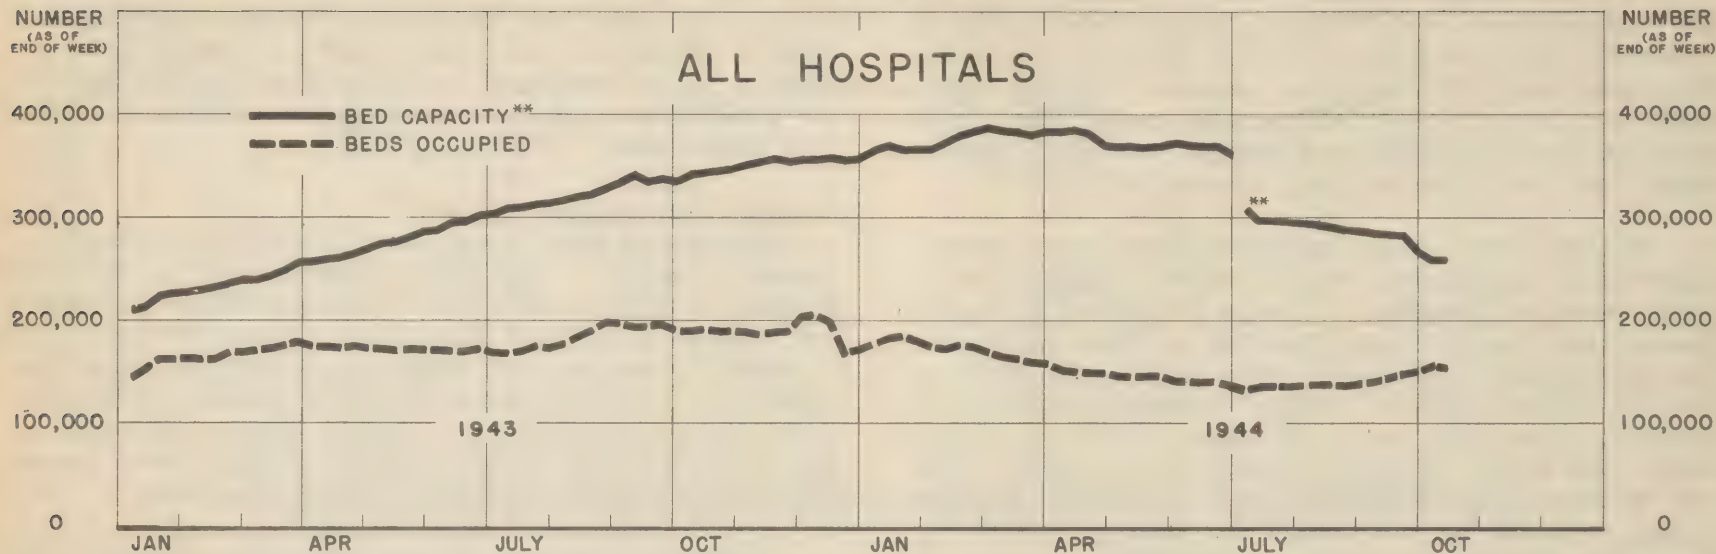

NON-EFFECTIVE RATE:

The non-effective rate increased for the thirteenth consecutive week to 47.4 per thousand; this is the highest rate recorded during this war. More than 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

# HOSPITALIZATION DATA\*

CONTINENTAL UNITED STATES

\*EXCLUSIVE OF BEDS REPORTED IN DISPENSARIES, CONVALESCENT FACILITIES, VENEREAL DISEASE FACILITIES, AND COLLEGE TRAINING UNITS.

\*\*AFTER JUNE 1944 DATA ARE FOR AUTHORIZED BEDS

† ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

## COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 47.0 per thousand strength. The number of neuropsychiatric cases remaining as of 13 October 1944 was reported at 20,346 or about 300 more than the previous week; out of the 20,346 cases 10,139 were in General Hospitals. The number of neuropsychiatric cases remaining was at the highest point during this war.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 13 October 1944 totaled about 31,700. The number of battle casualty patients remaining increased by about 2,400 to 21,976; all but 583 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 13 October 1944 the total number of enlisted men discharged by CDD was 4,828 or about 400 less than the previous week. About 47 percent of these discharges were reported by General Hospitals.

Included among the 4,828 CDD's were 1,761 neuropsychiatric cases, representing 36 percent of the total; the number of such cases among the previous week's CDD's was 1,983 or 38 percent of the total.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds in General, Regional, Station, and Convalescent Hospitals as of 13 October 1944 numbered about 259,000 or 1,000 less than at the end of the previous week. The total number of beds occupied was 154,000 (or 59 percent of the total beds authorized) which was about 1,000 less than at the end of the previous month.

The total authorized beds in General Hospitals (exclusive of beds in convalescent facilities) numbered 114,313. The total beds occupied in General Hospitals

were 63,590 (or 56 percent of the authorized beds) which was about 1,100 more than at the end of the previous week and the highest number ever reported.

The bed capacity of convalescent facilities in General Hospitals was 21,513. The total beds occupied in such convalescent facilities was 7,540 or 35 percent of the total bed capacity. The above figures include 10,372 convalescent facilities beds (3,484 or 34 percent occupied) at the six General and Convalescent Hospitals.

On page 27 there are presented summary data on Army and non-Army patients at General Hospitals as of 13 October 1944. Also shown is a subdivision of hospital beds available in General Hospitals.

Station Hospitals (as distinct from Regional and Convalescent Hospitals) reported about 82,000 total authorized beds, while Regional Hospitals reported about 60,000 beds. The number of beds occupied at Station Hospitals was about 47,000 or 57 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 40,000 or 67 percent of total authorized beds.

Not included among the station hospitals are 13 which are designated as Convalescent Hospitals (ZI), (added this week were Miami Beach, AAF, Fla. and Fort Thomas, AAF, Ky. while Camp Butner, N.C. was removed). These hospitals reported 3,094 authorized hospital beds (2,671 or 86 percent occupied) and in addition 13,537 beds in convalescent facilities (4,759 or 35 percent occupied).

Eighteen stations reported more beds occupied as of 13 October 1944 than authorized.

# SUPPLEMENTARY HEALTH REPORT

## HOSPITALIZATION AT CONVALESCENT FACILITIES AT OTHER THAN GENERAL HOSPITALS

Data regarding convalescent facilities at Regional, Convalescent, and Station Hospitals as of 29 September 1944 are shown on page 34. Corresponding data for General Hospitals as of the same date were published in Weekly Health Report No. 39 (pages 28 to 31).

As of 29 September 1944 convalescent facilities were reported by 16 Regional Hospitals (out of a total of 56 such hospitals in operation), by 10 Convalescent Hospitals, and by 11 Station Hospitals. The total bed capacity of convalescent facilities at these 37 hospitals was 23,294; 7,360 of these beds (or 32 percent) were occupied. The convalescent bed capacity of 23,294 at these 37 hospitals is about 1,600 greater than as of 25 August 1944. The increase in bed capacity is accounted for by the opening during September of Convalescent Hospitals at Camp Upton, N.Y., Fort Story, Va., and Camp Carson, Colo. which more than offset the decrease due to closing of small convalescent facilities at about 10 Station and Regional Hospitals.

Not included in the attached table is the convalescent facilities of 2,000 beds at McAlester, Okla. PW Camp with 2,019 reported as occupied.

In comparison with the convalescent facilities at the 37 Regional, Convalescent, and Station Hospitals, some 41 General Hospitals (out of a total of 60) reported as of 29 September 1944 a total convalescent bed capacity of 21,912; of these 7,659 (or 35 percent) were occupied. Thus, the convalescent facilities at Regional, Convalescent, and Station Hospitals had about 5 percent more convalescent facilities beds and about 5 percent fewer beds occupied than the convalescent facilities at General Hospitals.

The Eighth Service Command had the greatest number of convalescent facilities beds (about 28 percent of the U.S. total), closely followed by the Seventh and Ninth Service Commands (with 22 and 18 percent respectively).

The ten Convalescent Hospitals which reported convalescent facilities had 14,349 convalescent facilities beds of which only 3,148 (or 22 percent) were occupied. Since these installations have been set up quite recently, the proportion of beds occupied is still very low but may be expected to increase steadily in the near future.

The Supplementary Report on the reconditioning program published on page 35 of this Report gives more detailed analyses of the convalescent and reconditioning program data at Regional, Convalescent, and Station Hospitals. However, it should be noted that many hospitals maintain reconditioning programs even though they have no buildings specially designated as convalescent facilities; see par. 36b(3), AR 40-1080 for definition of this term.

During the five week period ending 29 September 1944 the number of enlisted men discharged by CDD at the Convalescent Hospitals listed was 337 distributed as follows:

Old Farms C.H., Conn.	7
Upton, Cp., N.Y.	1
Story, Ft., Va.	80
Nashville AAC, Tenn.	43
Welch C.H., Fla.	47
Carson, Cp., Colo.	24

# SUPPLEMENTARY HEALTH REPORT

## CONVALESCENT AND RECONDITIONING PROGRAM DATA

Under the provisions of paragraph 36r, AR 40-1080, Changes No. 2, the numbers of Class 1, Class 2, Class 3, and Class 4 patients discharged for disability, returned to duty, and remaining in convalescent and reconditioning programs are required to be reported weekly on WD MD Form 86ab. Class 1 patients are those nearest to recovery and able to engage in fairly strenuous physical activities, Class 2 patients are in the same category but not as advanced, Class 3 are ambulant patients under treatment, and Class 4 are bedridden patients.

As of 29 September 1944, the number of patients remaining in hospital (and convalescent facilities) at stations reporting the required data on the convalescent and reconditioning program represented 98 percent of all such patients in all hospitals in the continental U.S. The remaining 2 percent are accounted for in part by certain hospitals which have too few patients to institute such programs (e.g. Prisoners of War Camps and other installations with small numbers of U.S. Army patients). As of the end of September, practically all large stations throughout the entire country were reporting such data, except for several Transportation Corps hospitals which had not set up reconditioning programs.

In the following tables are listed separately within each Service Command for each General Hospital, each other ASF hospital, and each AAF hospital: (1) the total Army patients remaining at the end of the period (29 September 1944); (2) the total number discharged with Certificate of Disability for Discharge (CDD) during the five-week period ending 29 September; and (3) the number returned to duty

during this period. The number of Class 1, Class 2, Class 3, and Class 4 patients as well as the total number in the reconditioning program are shown for each station. It should be noted that the reconditioning programs are generally in effect throughout the hospital and are not confined to the convalescent facilities in those stations that have both hospital beds and convalescent facilities beds.

For the total United States, 72 percent of the total patients remaining in hospital as of 29 September were participating in the reconditioning program as compared with 71 percent as of the end of August. In General Hospitals, which accounted for almost 50 percent of the total patients, the corresponding proportion for the end of September was somewhat higher (76 percent), while for other ASF hospitals and AAF hospitals, the figures were 64 percent and 77 percent respectively. There was little change in the proportion by type of hospital as between the end of August and the end of September.

The proportion of total patients participating in the reconditioning program varied considerably as between Service Commands. The highest proportion (90 percent) was again reported by the Second Service Command followed by the First and Ninth Service Commands (with about 85 percent). On the other hand, the lowest proportions were registered by the Fourth and Eighth Service Commands where only about 65 percent of the patients remaining were in the reconditioning program. Both the Fifth S.C. and the MDW showed notable rises in proportion participating in September.

## CONVALESCENT AND RECONDITIONING PROGRAM DATA (CONT'D)

For the United States as a whole, the patients remaining in the reconditioning program were reported as subdivided by classes as follows:

	<u>Total</u>	<u>Class 1</u>	<u>Class 2</u>	<u>Class 3</u>	<u>Class 4</u>
Total U.S.	100%	9%	15%	46%	30%
Gen. Hosp.	100	4	11	57	28
Other ASF	100	8	16	42	34
AAF Hosp.	100	21	21	28	30

From this it may be seen that General Hospitals tended to have slightly more patients in Class 3 and slightly fewer in the other classes (particularly Class 1) than for the United States as a whole. The other ASF hospitals had relatively fewer patients in Class 3, while for AAF hospitals there were decidedly more patients in Classes 1 and 2 and considerably fewer in Class 3. This may reflect, to some extent, differences in classification of patients as between AAF and other hospitals, since many of the former had reconditioning programs some time before such were instituted on an Army-wide basis. All three types of hospitals show about the same proportions in Class 4. It is noteworthy that these distributions are almost identical with the ones prevailing at the end of Aug.

The distribution of patients remaining by class varied considerably by Service Command. The highest proportion of Class 4 patients was again reported by the Sixth Service Command (43 percent) with no other Service Command having a figure in excess of 32 percent; the lowest proportions of Class 4 patients were again shown by the First and Fifth Service Commands (about 23 percent). In respect to Class 3 patients, the highest proportion was again reported by the First Service Command (69 percent), while the Third, Fourth, Sixth, and Eighth Service Commands had the lowest proportion (about 40 percent).

The highest proportion of Class 2 patients was recorded in the Third Service Command (23 percent), while the lowest was in the First Service Command (4 percent). In respect to Class 1 patients, both the Fourth and Eighth Service Commands showed the highest proportion (13 percent), while the lowest was in the Second, Third, and Sixth Service Commands (4 percent).

Patients returned to duty from the reconditioning program quite naturally came primarily from Classes 1 and 2. The distribution by class was as follows: Class 1 — 39 percent, Class 2 — 22 percent, Class 3 — 30 percent, and Class 4 — 9 percent. This distribution for September is almost identical with that for the previous month. These proportions differed considerably as between General Hospitals, other ASF Hospitals, and AAF Hospitals. Thus, General Hospitals showed an unusually high proportion returned to duty from Class 3 (49 percent), while AAF hospitals showed a relatively large proportion returned to duty from Class 1 and 2 (50 and 31 percent respectively). Both General Hospitals and other ASF Hospitals showed about 48 percent returned to duty from Classes 1 and 2 combined, while other ASF hospitals showed an unusually high proportion returned to duty from Class 4 (11 percent).

Of the patients in the reconditioning program who were discharged with CDD's during the five-week period ending 29 September, 71 percent were from Class 3 (as contrasted with 63 percent in August); the remaining 29 were subdivided as follows: Class 4 — 12 percent, Class 2 — 12 percent, and Class 1 — 5 percent. In General Hospitals, where more than half of the CDD's were reported, 75 percent of those discharged were from Class 3 and only 12 percent from Classes 1 and 2 combined.

# SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 29 SEPTEMBER 1944

## WOMEN'S ARMY CORPS

During the five week period ending 29 September 1944 the annual admission rate from all causes among WAC personnel at 41 selected stations was 849 per year per thousand strength. This represents a decrease of about 5 percent from the rate recorded for August (see chart on page 67). The September admission rate from all causes for the WAC is about 50 percent in excess of that for the total Army in the continental United States, which reflects the well known fact that morbidity among women is usually about that much higher than among men.

The 41 selected stations for which details are given in the following tables include practically all of the installations which have a WAC strength of 300 or more. (A few of the stations listed have currently less than 300 strength, but in previous months their strength was above this figure and so they were included among those required to report.) The proportion of total WAC strength in the continental United States which is included in these 41 stations is more than 40 percent.

As in previous months morbidity from all causes during September showed considerable variation by station. The all causes admission rate for the majority of the stations ranged from 600 to 900 per thousand. The highest rates were reported from Arlington Hall Station, Fort Bragg, Fort Jackson, Wright Field, and Fort Riley, all of which had rates in excess of 1600 per thousand. All of these stations also reported relatively high admission rates in August as well as in previous months.

The September admission rate from injury for the WAC was 49 per thousand, representing more than a 30 percent decrease from August. This is the first month since data have been obtained for the selected WAC stations that morbidity from injury among the WAC was reported to be lower than for the total Army in the continental United States (about 70 per thousand in September).

As in August the two largest stations, Fort Oglethorpe and Fort DeMoines (which account for about 40 percent of the total strength of the 41 selected stations), experienced somewhat lower morbidity than the other stations. Prior to August, these two stations had reported somewhat higher morbidity than all the other installations combined.

Morbidity from colds, influenza, etc. among the WAC increased sharply (by more than 40 percent) during September to a rate of about 140 per thousand. This rate is about 75 percent higher than that for the total Army in the continental United States. It is noteworthy that the great majority of the stations reported morbidity in excess of 100 per thousand from these causes.

Morbidity from diarrhea and dysentery among the WAC was reported at 17 per thousand, in contrast with a rate of about 10 per thousand for the total Army. The relatively high rate for the WAC reflected largely the unfavorable experience at Fort Oglethorpe, where almost 70 percent of the total cases occurred; this station has reported high morbidity from these causes during the last few months. Morbidity from other communicable diseases shown in the following tables was at a low level.

## WOMEN'S ARMY CORPS (CONT'D)

In September neuropsychiatric disorders were responsible for an annual admission rate of 37 per thousand or somewhat lower than the rate reported in August and about the same as in June and July. The morbidity experience from these causes among the WAC continues to be considerably above that for the total Army.

The number of CDD's during September averaged 26 per week or about the same as during August but well above the average of 15 per week in June and July.

As of 29 September there were 725 WAC patients remaining in hospital and quarters at the 41 selected stations. In addition to the 623 WAC's remaining in hospital at the selected stations there were 456 WAC's occupying beds in General Hospitals (exclusive of Walter Reed, Army and Navy, and Madigan which are among the selected stations). The number of WAC's occupying beds at Station and Regional Hospitals, exclusive of the 41 selected stations, was 935. Thus, the total number of WAC's occupying hospital beds as of the end of September was about 2000 or only slightly higher than the corresponding figure for the end of August.

The number of WAC's occupying hospital beds as of the end of September represented a rate of 29 per thousand strength of the WAC in the continental United States or about the same as during the previous two months. For the total Army in the continental United States the corresponding figure is about 44 per thousand, but this includes a relatively large number of evacuees from overseas. When evacuees are excluded, the revised rate for the total Army in the United States would be in the neighborhood of about 30 per thousand. Thus, whereas

the overall admission rate for WAC personnel is about 50 percent higher than that for the Army as a whole, the incidence of serious conditions as reflected by the proportion of WAC personnel in hospital appears to be much the same as for other Army personnel.

# SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 29 SEPTEMBER 1944

## PRISONERS OF WAR

During the five week period ending 29 September 1944 the admission rate from all causes among prisoners of war was 622 per year per thousand strength. This rate is about 10 percent higher than the September rate for U.S. troops in the continental United States. The admission rate from all diseases combined for prisoners of war was 498 per thousand or about the same as for U.S. troops, while the admission rate from injury was 124 per thousand or about 70 percent higher than for U.S. troops (see chart on page 73).

Morbidity from disease among prisoners of war during September was about 5 percent higher than during August but about 5 percent lower than in June and July; morbidity from injury remained at approximately the same level as during recent months (see chart on page 74).

Over 95 percent of the total strength of the prisoners of war in the continental United States (as reported by The Provost Marshal General) is included in the reports received in the Office of The Surgeon General. The strength not reported represents largely prisoners in penal and medical institutions and those en route from ports of debarkation to prisoners of war camps for whom no reports are required to be submitted. It should be noted furthermore that the strength figures shown in the following tables represent the mean strengths for the period indicated and are not the strengths as of the end of the period.

Italian Service Units continue to experience considerably higher morbidity than Italian prisoners but only slightly higher than German prisoners. A large part of the latter differential reflects higher

morbidity from respiratory causes among personnel of Italian Service Units. Morbidity among the relatively small number of Japanese prisoners continues low.

Morbidity from injury among German prisoners remains relatively high, at 131 per thousand. For Italian Service Units the rate was only slightly lower (120 per thousand), but the corresponding rate for Italian prisoners was extremely low (24 per thousand).

Morbidity from colds, influenza, etc. among prisoners of war rose sharply from the very low rate of 39 per thousand for August to 57 per thousand for September. Nevertheless, the experience among prisoners of war continues very much more favorable than for U.S. troops, for whom current morbidity from these causes is at a rate of about 80 per thousand. Just as in previous months morbidity from these causes was highest for Italian Service Units (116 per thousand), followed next by German prisoners (49 per thousand), with Italian prisoners having the lowest morbidity (32 per thousand).

During September morbidity from malaria, representing predominantly cases presumably acquired outside the United States, was at a rate of 31 per thousand as contrasted with 40 per thousand for August. Morbidity from this cause has been declining continuously since April when the record high rate of 94 per thousand was recorded. The number of cases of malaria reported as being presumably acquired in this country was 7, which is materially lower than the number of cases reported during each of the previous 3 months.

The September admission rate for diarrhea and

## PRISONERS OF WAR (CONT'D)

dysentery of 14 per thousand was the same as in August, or somewhat higher than the recent experience of U.S. troops in this country. During September there were reported 9 new cases of diphtheria which is the highest number recorded in any month since the early part of the year. In addition, there was reported 1 new case of poliomyelitis and 1 new case of typhus fever. New cases of the other communicable diseases considered in the following tables were relatively few.

The camps reporting the highest morbidity from disease were Fort John Custis, Va. (G), Camp Gordon Johnston, Fla. (G), Camp Davis, N.C. (G), Ashford, W. Va. (G), Camp Breckinridge, Ky. (G), Fort Lewis, Wash. (G), and Imperial Dam, Ariz. (ISU), all of which had rates of more than 1500 per thousand. Most of these camps also had relatively high morbidity during August and previous months.

High morbidity from injury was reported by the following camps: Camp Davis, N.C. (G), Camp Fannin, Tex. (G), McAlester, Okla. (G), and Fort Andrews, Mass. (ISU), all of which had rates in excess of 500 per thousand, Clinton, Miss. (G), with a rate of 421 per thousand, has reported morbidity in excess of 300 per thousand during every month of this year.

The number of prisoners of war remaining under treatment in hospital and convalescent facilities at prisoner of war camps as of 29 September 1944 and the corresponding rates per thousand strength are shown below. The total number of such prisoner patients at the end of September was about 35 percent higher than at the end of August reflecting in large part the increasing number of prisoners of war in this country. Out of the 6782 prisoner patients, 1043 were at Glenan G.H., Okla., 1098 at McAlester, Okla., and 815 at Camp Gruber, Okla.; thus, almost half of the German prisoners remaining under treatment were at these 3 installations.

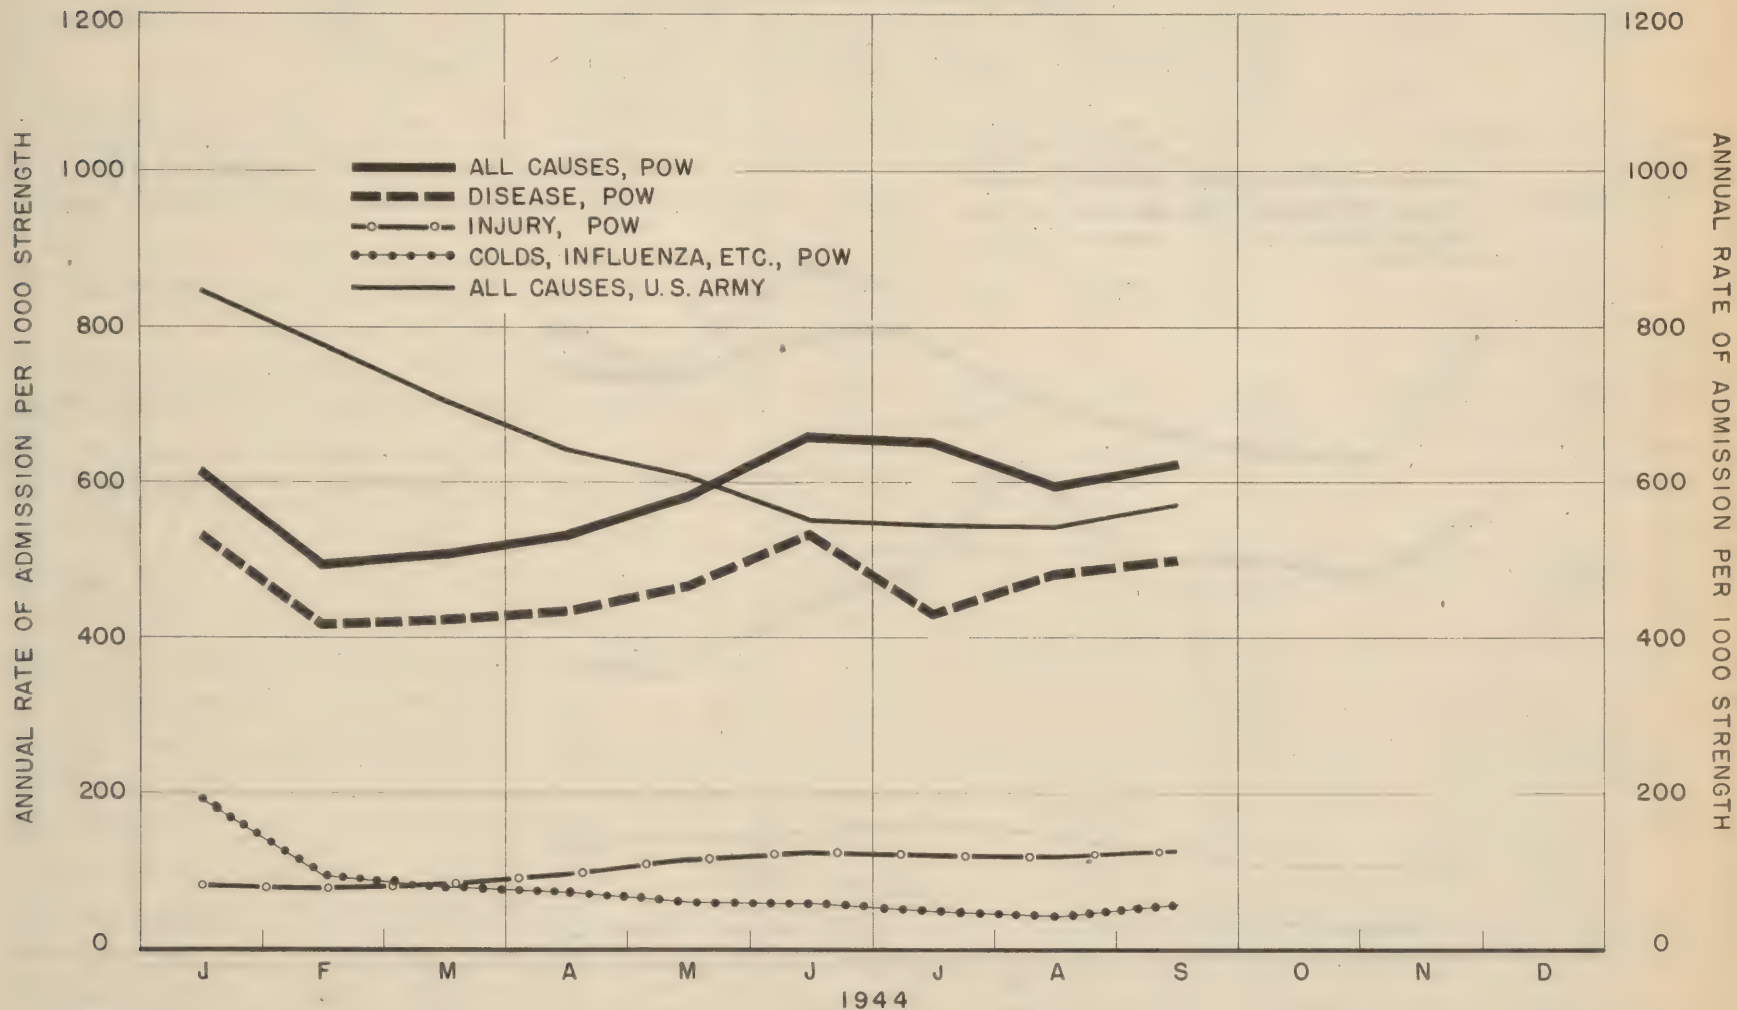

In addition to the prisoners of war remaining under treatment at the prisoner of war camps or special hospitals for prisoners of war there were 1689 remaining under treatment in other hospitals; of these 1537 were in General Hospitals (chiefly at Bushnell, Fitzsimons, Halloran, and Mason).
